## Mechanized skinbooster technique with anesthesia without needles

**Manuela Bafini Fonseca**

UNESP-Sao Paulo State University, Brazil

The concept of a booster is nothing more than that some active function as an "enhancer", therefore a concept applied to potentiate a treatment. The selected material was the solution of hyaluronic acid from the next pharmacy composed of several substances that will act in the process of improving the quality of the skin. The application protocol is the use of comfort in which is a powerful alternative to solve problems related to the use of injections (needleless injection devices). They allow the administration of drugs, such as anesthetics to the skin, non-invasively, through high-speed jets. The anesthetic used was articaine, the selected points of analgesia supra and infraorbital and the region of mentonian. The product is delivered by another device called dermashot, a computerized injection system that delivers it at the desired speed and quantity.

### Biography

Manuela Bafini Fonseca completed her master's degree in endodontics at the age of 27 from UNESP - Sao Paulo State University and doctoral studies from the same university in periodontology. Since then she has given courses in the area of orofacial harmonization throughout Brazil with the BMS team.
